

# Battery BMS Sleep

## Overview

---

Why does my BMS battery go into sleep mode?

When a BMS battery goes into the sleep state, it essentially enters a low-power mode to preserve its overall health. This can happen for several reasons, including long periods of inactivity, over-discharge, or a fault within the bms battery management system itself.

Can a BMS go into sleep mode?

For a BMS to go into sleep mode, the cell groups generally have to fall well below the LVC (Low Voltage Cutoff) point. This can happen when the battery is stored and not used for an extended period of time. In this case, the cell groups need to be individually charged directly, rather than through the BMS in series.

Can you wake up a BMS battery?

Waking up a BMS battery can pose certain risks, both to the battery itself and to the individual attempting the wake-up procedure. One of the main risks is related to the low-voltage state of the battery.

How to wake a sleeping lithium battery?

From connecting the battery to a charge from a solar panel, to warming up the battery and even connecting your sleeping battery in parallel to another LiFePO4 battery. The steps below are the safer and easier way to wake a sleeping lithium battery. Use a battery voltage tester or a multimeter to measure the voltage of your battery.
