

# Bidirectional Charging Protocol for Mobile Energy Storage Containers

## Overview

---

Can unidirectional and bidirectional charging be integrated into a hybrid energy storage system?

In the case of bidirectional charging, EVs can even function as mobile, flexible storage systems that can be integrated into the grid. This paper introduces a novel testing environment that integrates unidirectional and bidirectional charging infrastructures into an existing hybrid energy storage system.

Why is bidirectional charging important?

Bidirectional charging opens up immense storage potential. The mobile storage units in electric vehicles, even if they are individually very small from an energy system perspective, have immense storage potential due to their very large number, which can be leveraged through bidirectional charging.

Do EV chargers support bidirectional power flow?

To fully utilize this potential, EV chargers must support bidirectional power flow, enabling seamless energy exchange between the grid and vehicles. This capability extends to wireless charging systems, which are gaining popularity due to their convenience, safety, and efficiency.

Can bidirectional charging reduce the need for large-scale battery storage?

The additional use of this storage capacity for bidirectional charging could reduce the need for large-scale battery storage beyond the scope of the Electricity Network Development Plan (NEP) and the associated costs and resource consumption. Bidirectional charging is economical for customers
