

# **Charging station energy storage operation scheduling method**

## Overview

---

Why is optimal charge/discharge scheduling important in power distribution networks?

However, the intermittent nature of renewable energy sources poses a challenge for energy management in power distribution networks. To address this, optimal charge/discharge scheduling of EVs becomes crucial.

How can EV charging stations optimize the day-ahead Power Plan?

Through rolling optimization and correction, this approach tracks the day-ahead power plan and optimizes the dispatch for energy storage and V2G in real-time. Finally, case studies based on an actual EV charging station located in Shanghai validate the effectiveness of the proposed methodology. 1. Introduction.

How to optimize the economic operation of a charging station?

The model involving PV, ES, and EVs can optimize the economic operation of the charging station. Compared to the original disordered charging, the operational costs of two typical days analyzed were reduced by 17.80 % and 13.51 %, respectively. ii). Joint optimization through V2G and ES can better reduce peak loads compared to using ES alone.

How to address intra-day stochasticity in EV charging stations?

To address intra-day stochasticity, an MPC based real-time optimization scheduling method for the EV charging station is proposed, demonstrating effective tracking of the day-ahead plan while mitigating intra-day randomness with errors constrained within 5 %.
