

# Graphite cloth for flow battery electrodes

## Overview

---

Which electrodes are used in flow batteries?

Currently, carbon-based porous electrodes, commonly graphite felt (GF), carbon felt (CF), carbon cloth (CC), and carbon paper (CP), are extensively employed in flow batteries due to its advantageous stability, excellent electrical conductivity, and superior corrosion resistance .

Does heat treatment of graphite felt improve redox flow battery electrochemical properties?

And compared with graphite felt electrode with unheated simple, the study found that: heat treatment of graphite felt was beneficial to the improvement of the redox flow battery cathode electrochemical properties, and the improvement of redox flow battery anode electrochemical activity.

What is a bi-layer graphite felt electrode?

To this end, herein, a Bi-layer graphite felt electrode that possesses both activated oxygen and nitrogen co-doped outer catalyst layer and stabilized carbon fiber-based inner supporting layer, is proposed and developed for ZBFs.

Why is graphite felt a good electrode material for icrfb?

ICRFB has around wide concern as it possesses advanced characteristics such as high energy, long cycle life, and environmental friendly. Graphite felt is a common electrode material for ICRFB because of its high temperature resistance, corrosion resistance, infinite specific surface area, and admirable electroconductibility.
