# How many times can solar power be charged and discharged with energy storage

## Overview

---

Should I install batteries in my solar storage system?

This is why many people consider installing batteries in the first place. If your battery storage system only does solar charging, your battery will cycle at most once per day. Example energy flow chart illustrating battery charge/discharge on a solar-only charging regime.

What is the cycle life of a solar battery?

A battery's cycle life is the number of times it can be fully charged and discharged before its capacity significantly decreases. The cycle life of a solar battery is a key factor to consider when evaluating the longevity and cost-effectiveness of your solar energy system. There are various types of solar batteries, including::

What factors affect the cycle life of a solar battery?

The cycle life of a solar battery is influenced by several factors, including:  
Depth of Discharge (DoD) - The percentage of a battery's energy capacity that is used before recharging. A higher DoD can reduce the battery's lifespan.  
Temperature - Extreme temperatures can negatively impact a battery's performance and longevity.

What is solar charging & how does it work?

Solar charging is the most obvious use for batteries in residential situations. As the term implies, solar charging is when you use your solar PV system to charge up your battery bank. Most of the time this will happen when you are out during the day (for example, at work) and when your solar energy might otherwise be 'wasted'.
