

# **Is it hot underneath the rooftop solar panels**

## Overview

---

Are solar panels hot?

Most solar panels have a rated “solar panel max temperature” of 185 degrees Fahrenheit - which seems intense. However, solar panels are hotter than the air around them because they are absorbing the sun’s heat, and because they are built to be tough, high temperatures will not degrade them. Are solar panels hot to the touch?

.

What is solar panel heat?

Solar panel heat is the rise in temperature that solar panels experience when they absorb sunlight. The temperature increases due to the photovoltaic effect - the conversion of light into electricity - which is not 100% efficient and results in the generation of heat. The effects of this temperature rise on solar panels are multiple:.

Why are solar panels hotter than external temperature?

Because the panels are a dark color, they are hotter than the external temperature because dark colors, like black, absorb more heat. For example, the ambient temperature in the desert can reach 113 degrees Fahrenheit, meaning solar panels in this climate can reach 149 degrees Fahrenheit.

Why do solar panels get hot?

When solar panels get hot, the operating cell temperature is what increases and reduces the ability for panels to generate electricity. Because the panels are a dark color, they are hotter than the external temperature because dark colors, like black, absorb more heat.
