What happens when a bidirectional energy storage converter loses connection?

When the bidirectional energy storage converter loses connection with the main grid, due to the loss of the grid's clamping effect and without switching to islanding mode, the PCC frequency will undergo a disturbance process until it reaches a new steady state. During this process, the load phase angle is.

Is droop control a smooth switching strategy for bidirectional energy storage inverters?

Due to the disruptive impacts arising during the transition between grid-connected and islanded modes in bidirectional energy storage inverters, this paper proposes a smooth switching strategy based on droop control to mitigate such impacts.

How does a microgrid work?

The microgrid operates in a steady-state condition under the islanding mode and then switches to grid-connected operation after pre-synchronization control. From $t = 0$ to 0.6 s, the microgrid starts in islanding mode and achieves a stable operation. At $t = 0.2$ s, the bidirectional energy storage inverter initiates pre-synchronization adjustment.
