

# Which is better shingled solar panels or single crystal solar panels

## Overview

---

Why are shingled solar panels better than conventional solar panels?

Shingled solar panels can produce higher power per square meter than conventional panels since they no longer require several meters of ribbon across the module, allowing a full effective area of utilization. This means there are more solar cells exposed to sunlight and producing more energy.

Why should you choose a shingle solar panel?

Better Mechanical Properties - Static and dynamic load tests have shown that the shingle method is more resistant to failures due to external forces applied to the solar panel than conventional solar panels. In addition, the conductive adhesive used on the stacked shingle cells helps reduce internal stresses due to thermal expansion.

What is the difference between conventional and shingled solar cells?

However, the most relevant difference between conventional and shingled solar cells in terms of their composition and structure—is the interconnection or layout of them. Every solar panel contains different amounts of cells interconnected or arranged in different ways depending on the desired output.

How efficient are shingled solar panels?

Whether you are using mono PERC, half-cut MBB, or any other available solar technology, the percentages of panel efficiency range from 15% to 22.6%. Nevertheless, the shingled panels can achieve efficiencies from 18% to 20.5%. Furthermore, like many other PV module advancements, shingling can be combined with glass-glass and bifacial techniques.
