

Why does the base station need power control

Overview

What does a base station controller do?

Network Optimization is a vital function in mobile network management, and the Base Station Controller (BSC) plays a critical role in this process. The BSC is responsible for making sure that network resources—such as radio channels and power—are used as efficiently as possible.

How can a base station reduce energy consumption?

Significant efforts are being made to reduce the overall energy consumption of base stations to lessen their impact on the environment. Electrical energy is the principal source of everyday operating costs in a base station, and the PA can be responsible for more than half of the power dissipation.

Why is power efficiency important in a base station?

Electrical energy is the principal source of everyday operating costs in a base station, and the PA can be responsible for more than half of the power dissipation. Thus, optimizing the PA's power efficiency improves operational performance, and provides environmental and financial benefits.

Why do we need a base station?

Technological advancements: The New technologies result in evolved base stations that support upgrades and enhancements such as 4G, 5G and beyond, its providing faster speeds with better bandwidth. Emergency services: They provide access to emergency services, so that in case of emergency, people can call through their mobile phones.
